OUR PATH TO THE CERTIFIED CIRCULAR ECONOMY

BUILDING FACADES BY RECYCLING WINDOWS
WHAT ARE THE MAIN BUILDING CHALLENGES WITH RESPECT TO SUSTAINABILITY?
In today’s world, we are highly aware of environmental issues and, increasingly, a product’s life cycle. From manufacturing to obsolescence, this is now a priority factor when it comes to using certain products over others. The aim is to implement new industrial processes that meet these product recyclability needs.
OUR PATH TOWARDS THE CERTIFIED CIRCULAR ECONOMY

CERTIFY THE MATERIAL

We extract our profiles using low CO₂-footprint aluminium. We achieve this by using renewable energy and recycling post-consumer aluminium. The entire recycling process is certified by DNV - GL, Det Norske Veritas, an independent certification company with headquarters in Oslo, Norway and 350 offices in over 100 countries around the world. The Hydro group, to which SAPA belongs, was the first company to achieve recognition from the Aluminium Stewardship Initiative (ASI), the most internationally recognised standard for assessing sustainability throughout the life cycle of aluminium, from its extraction and production to the use and recycling thereof.

CERTIFY BUILDINGS

LEED, BREEAM, WELL, VERDE, LEVEL[s] are the most well-known certification systems for assessing the environmental impact of buildings. Among the most relevant requirements to be awarded their certifications are the credits given to the materials used. In addition to offering products with a reduced impact on the environment, we can provide all the certifications that contribute to achieving the different green seals that are currently on the market.

This aluminium is obtained by melting old windows at the end of their life cycle or other objects with an equivalent alloy. This process makes it possible to reduce damage at the extraction site, in addition to reducing the depletion of non-renewable raw materials, sludge from manufacturing, consumption of non-renewable energy and greenhouse gas emissions. In short, it is a much more environmentally friendly product than primary aluminium and contributes to the development of the circular economy.

**HOW IS IT OBTAINED?**

Its production process is characterised by a rigorous selection of the material to be recycled with the aim of achieving the optimum alloy to manufacture carpentry profiles. Aluminium is a material that can be found in dozens of different alloys (i.e. combinations with other elements such as magnesium, manganese, copper, zinc, silicon, titanium and chrome) depending on the industrial use for which it was produced. A Hydro plant in Dormagen (Germany) has developed a technology to effectively separate aluminium from other metals and to use each for correct recycling. This system allows only the recycled aluminium with the right alloy to be used to produce windows that are sent to Hydro’s smelting plants.

**Hydro, SAPA SUPPLIER OF RECYCLED ALUMINIUM**

The Norwegian multinational Hydro owns the SAPA brand and supplies all the aluminium used to manufacture the windows. With over 20,000 employees and production plants worldwide, Hydro is the world’s largest producer of aluminium. Its material is used to make trains, cars, planes, computers, mobile phones, beverage cans and many other objects used in daily life. With the launch of Hydro CIRCAL 75R, Hydro has introduced the first certified post-consumer recycled aluminium onto the market.

Consult or download the Environmental Product Declarations (EPD) for construction products (DAPc), available at [www.epd-norge.no](http://www.epd-norge.no) entering the term Hydro 75R.
Together with urban mining, which involves the reintroduction of materials already in use into products in a new life cycle or manufacturing process, Hydro limits the environmental impact of its industrial processes by using renewable energies. Hydro REDUXA 4.0 is a primary aluminium that generates a carbon footprint of 4 kg of CO₂ per kg of aluminium, well below the European average of 6.7 kg of CO₂. As with the Hydro CIRCAL 75R, the Hydro REDUXA 4.0 production process is fully traceable and certified by the independent external body, DNV-GL, which guarantees its low carbon emissions.

Consult or download the Environmental Product Declarations (EPD) for construction products (DAPc) available at www.epd-norge.no entering the term Hydro 4.0.
Aluminium

100% infinite

Unlike other materials, aluminium can be fully recycled without any loss in its quality or physical properties. It is estimated that, worldwide, there are 200,000,000 tonnes of aluminium objects that, when their life cycle comes to an end, can be 100% usable. Hydro uses this process to replace the extraction of bauxite (the ore from which aluminium is obtained) with the recycling of post-consumer material. The aim is to limit the exploitation of natural resources, even though aluminium is the third most abundant element on the planet. But, above all, to prevent objects from being discarded into the environment that may have another infinite life. This process is called urban mining and aims to turn cities into the main supply points of raw materials, thereby keeping the natural spaces that still remain on earth intact.

FROM THE LINEAR TO THE CIRCULAR ECONOMY

Bauxite + Alumina + Energy = Primary Aluminium

Extrusion → Windows

Recycling

75%
of post-consumer recycled aluminium

Hydro CIRCAL 75R is the world’s first certified recycled aluminium. 75R means that at least 75% of new aluminium comes from post-consumer material. The substantial difference with other more common industrial processes that use their own manufacturing waste is that Hydro CIRCAL finds a new life for windows that have already been used in a building. Far from being the final result, for Hydro CIRCAL, 75% is a minimum requirement for a continuous process that aims to progressively reach total recycling.
With the current industrial processes, the production of primary aluminium (from the extraction of Bauxite) requires a large amount of energy, which results in abundant emissions of CO₂, the main greenhouse gas and direct cause of climate change. Post-consumer aluminium remelting saves up to 95% of this energy, obtaining a raw material of exactly the same quality.

The result of using Hydro CIRCAL 75R is a drastic reduction in emissions of more than 85%, if compared to the world average of primary aluminium production (18 kg of CO₂ per kg of material). With its 2.3 kg of CO₂ per kg of material, Hydro CIRCAL is currently the aluminium with the lowest emissions on the market. And the aim is to reduce them to total post-consumer recycling levels.

IMPACT OF SAPA FACADES

What is the difference between using our facades manufactured with Hydro CIRCAL 75R aluminium and facades manufactured with standard primary aluminium?

The average carbon footprint of aluminium consumed in Europe is 8.6 kg of CO₂ for every kg of aluminium.

With Hydro CIRCAL 75R, this impact drops to 2.33 kg of CO₂ for every kg of aluminium, which implies a savings of 6.27 kg of CO₂.

CARBON FOOTPRINT

Using an aluminium facade of 12 ton:

12,000 kg of primary aluminium x 8.6 kg of CO₂ = 103,200 kg of CO₂

12,000 kg of aluminium Hydro CIRCAL x 2.33 kg of CO₂ = 27,960 kg of CO₂

Using SAPA windows made with Hydro CIRCAL in this building represents a reduction of 75,240 kg of CO₂.
- 1 m² of construction with conventional materials = 750 kg CO₂/m²
- 1 m² of construction with low impact materials = 250 kg CO₂/m²
Energy consumption in the use phase of buildings has been drastically reduced over the last 30 years thanks to new policies, regulatory changes, updated training and the funding of R&D projects. Currently, by combining low demand, efficient installations, off-grid or on-grid renewable energy and the proper management thereof, it is possible to reach values close to zero in new builds or energy rehabilitation.

On the other hand, this energy reduction has not followed the same path in the material production phase. Furthermore, because the amount of materials used in an efficient building is greater, its energy content is decisive for the total resulting impact. Hydro CIRCAL 75R, with its low built-in energy level, takes a decisive step towards reducing the impact of materials on the life cycle of a building.
ENERGY CONSUMPTION OF BUILDINGS

- Before the 1993 Directive on the energy performance of buildings
- After the 2002 Directive on the energy performance of buildings
- Good Practices
- After the 2020 Directive on the energy performance of buildings

Operational energy consumption
Energy content of materials
A BIG RESPONSIBILITY
AND A HUGE OPPORTUNITY
According to the Level(s) document drawn up by the European Commission, the construction market is responsible for:

- 40% of total energy consumption
- 35% of greenhouse gas emissions
- 1/3 of the total waste generated
- 1/3 of total water consumption

**WHAT DO THE REGULATIONS SAY?**

**AT PRESENT...**

- For each country, it sets minimum reviews of energy efficiency requirements every 5 years
- Implementation in 2020 of EECN (Nearly Zero Energy Buildings)
  - From December 31, 2018: Public authority buildings.
  - From December 31, 2020: All new buildings.

Spanish Legislation - CTE: Modification of the DB HE (December 2019, currently in force).

**IN THE NEAR FUTURE...**

European Legislation - Climate and Energy Framework Year 2030 (referring to 1990 levels)

- 50% reduction in greenhouse gases
- Minimum 32% share of renewable energy
- Minimum 32.5% improvement in energy efficiency

Year 2050 (in reference to 1990 levels)

- 100% reduction in greenhouse gases
- Contribution of all sectors
